Spike Load Test Report

Build	Date	Specs Run	Specs Passed	Specs Failed	Pass Rate
#29	29 Jun 2026	5	4	1	80%

SUITE BREAKDOWN

Suite Name	Passed	Failed	Pass Rate
PG Webhook Spike Load Tests	4	1	80%

ASSESSMENT

The Revenue Management System Kenya spike load testing campaign achieved an 80% pass rate across five test specifications targeting 5000 virtual users, with four tests passing successfully and one test failure preventing the 90% target threshold. The system demonstrated resilience under most load scenarios including smoke, average, stress, and standard spike conditions, indicating the core infrastructure can handle significant traffic increases. The single test failure requires investigation to identify specific bottlenecks or resource constraints that manifest under the failing scenario's particular load pattern, as addressing this will improve overall system stability and help achieve the target pass rate for production readiness.

KEY FINDINGS

1. System successfully handled 4 out of 5 spike load scenarios at 5000 VU capacity
2. 80% pass rate indicates general system stability but falls short of 90% target threshold
3. Smoke, average, stress, and spike tests passed, suggesting core functionality remains intact under load
4. Single failure point identified in spike5k test specification requiring root cause analysis
5. System demonstrates capacity to handle 5000 concurrent virtual users in most scenarios

RECOMMENDED ACTIONS

1. Analyze spike5k test failure logs to identify specific performance bottlenecks or resource limitations
2. Review application monitoring metrics during the failed test to pinpoint memory, CPU, or I/O constraints
3. Implement performance profiling on critical system components that showed degradation during spike5k execution
4. Configure additional application-level caching or connection pooling to handle peak load scenarios
5. Optimize database queries and indexes that may be causing slowdowns under maximum load conditions
6. Schedule targeted retest of spike5k scenario after implementing performance improvements
